HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

REASONS FOR ALLOWANCE

Claims 1, 3, 33, 35, 36, 38, 39, 40, and 42-44 are allowed. The following is an examiner's statement of reasons for allowance:

The prior art teaches a shunt for transferring fluids between two cavities in the body, where the shunt may comprise an magnetically-driven pump. The pump may be selectively operated to transfer fluids between the first and second cavities. The prior art, however does not teach implanting a pump, electromagnetic motor, and integrated, programmable controller *subcutaneously within a patient's peritoneal cavity and establishing fluid communication between the peritoneal cavity and a patient's bladder*. Additionally, the prior art does not teach or suggest the placement of sensors in both the peritoneal cavity and the bladder, such that the pump is only activated when pressure in the peritoneal cavity exceeds a threshold pressure AND pressure in the bladder is lower than a second threshold pressure.

The closest prior art of record is Rubenstein (US 7,025,742), which teaches a method of shunting cerebrospinal fluid (CSF) from a cavity in the cranium to the peritoneal cavity. Fluid is transferred by a pump that provides a pressure difference across the shunt when a sensor disposed within the cranium detects a buildup of pressure. However, Rubenstein only provides a sensor at the inlet to the shunt. Because CSF flow involves relatively small quantities of fluid, the downstream pressure is not of consequence during the step of draining. By comparison, peritoneal-cavity-to-bladder shunting involves large amounts of fluid being transferred from the peritoneal cavity to the bladder. Therefore, the quantity/pressure of fluid present within the bladder

is critical, because attempting to drain the peritoneal cavity while the bladder is substantially full could result in retrograde flow. For this reason, applicant's argument (that one of ordinary skill in the art at the time of invention would not have looked to Rubenstein's shunt for use between the peritoneal cavity and the bladder) has been found persuasive.

Regarding the electromechanical pump, the closest prior art of record is Buchwald (US 4,610,658), which teaches a fluid shunt comprising a magnetically-driven pump. Neither Rubenstein nor Buchwald, however, teach or suggest that the pump, controller and power source (battery) are disposed *within* peritoneal cavity, nor do Rubenstein and Buchwald teach or suggest draining fluid from the peritoneal cavity to the bladder. Finally, Buchwald does not teach the use of sensors at the inlet and outlet of the shunt. The instantly claimed device provides the advantage of draining excessive fluid from the peritoneal cavity into the bladder, such that it may be removed from the body during urination. This treatment method provides a natural means for treating chronic ascites.

Additionally, Berglund (US 4,416,657) teaches a shunt that is capable of transferring fluid from the peritoneal cavity to the bladder. However, Berglund relies on a manually-activated valve (see Figure 3) that allows the user to selectively open and close the flow path. Berglund does not teach or suggest that the shunt must only be capable of unidirectional flow, and retrograde flow from the bladder to the peritoneal cavity could potentially have dire consequences. For this reason, one of ordinary skill in the art would not have been capable of modifying Berglund's shunt with a modern

control system, because doing so would completely change the structure and operation of the shunt.

For these reasons, one of ordinary skill in the art at the time of invention would not have looked to Rubenstein, Buchwald or Berglund. No prior art reference teaches or suggests implanting a pump and sensor within the peritoneal cavity, implanting the opposite end of the shunt and a second sensor in the bladder, and *programming a controller to activate an electromechanical motor to pump fluid from the peritoneal cavity to the bladder responsive to the first pressure sensor detecting a pressure in the peritoneal cavity exceeding a first predetermined threshold and the second sensor detecting a pressure in the bladder lower than a second predetermined threshold pressure*. The claimed system substantially prevents drainage when pressure in the bladder is too high.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
